Professional Summary

Frontend Software Developer and recent Computer Engineering graduate with a strong focus on building responsive, scalable web and mobile applications. Highly proficient in JavaScript frameworks like React and cross-platform tools like Flutter. Passionate about bridging UI/UX and User Experience design with robust engineering, utilizing RESTful APIs and Version Control in Agile and Scrum environments to deliver impactful, user-centric software.

Education

Batangas State University - Alangilan Campus — Batangas City, Batangas, Philippines
Bachelor of Science Computer Engineering — August 2022 - July 2026
DOST-Science Education Institute S&T Scholar

Experience

Creotec Philippines Inc. — Binan City, Laguna, Philippines
Frontend Web Developer Intern — February 2026 – April 2026

- Collaborated within a 4-person development team using Agile and Scrum methodologies to scaffold and deploy a scalable web application for the TESDA Mechatronics NCII curriculum using React and Tailwind CSS.
- Managed project deliverables and feature sprints within a strict schedule to guarantee a stable release delivered 1–2 weeks ahead of schedule.
- Engineered an administrative console prototype consolidating 8 core management features into a single dashboard, reducing management time by 30% for executive review.
- Integrated secure password recovery flows and sanitized credential parsing utilizing Brevo and RESTful APIs to ensure reliable account retrieval, decreasing account lockouts by 90%.

Skills

- **Programming:** C, C++, Dart, Python, JavaScript, TypeScript
- **Frameworks & Libraries:** JavaScript frameworks (React.js, Tailwind CSS), Flutter
- **Databases, Cloud & Architecture:** Firebase, SQLite, Supabase, RESTful APIs
- **Tools & Methodologies:** Version Control (Git, GitHub), UI/UX Design (Figma, Affinity), User Experience, Agile & Scrum Methodologies, MS Office, VS Code

Projects

CREOTEC SIM-MECHA: Interactive TESDA Mechatronics Simulation | Lead Frontend Developer

- Architected a 2D interactive canvas in Konva.js to replicate mechatronics hardware, driving performance optimization by reducing React re-renders to near-zero and maintaining a steady 60 FPS under heavy loads.
- Developed a custom Dijkstra pathfinding algorithm to route simulated cables through physical gutters, cutting routing calculation latency by 45% via imperative graphics references.
- Designed an immersive user interface featuring fluid animations, a gamified Mecha Map, and an automated SVG-driven onboarding tutorial to enhance student engagement rates and User Experience.
- Implemented client-side sequential unlocking logic and persistent state saving to automatically capture and restore 100% of exact wiring configurations across training sessions.

PING: Personnel In-Room Notification Grid for CpE Faculty | Software Developer

- Developed a responsive web application using React and TypeScript to provide real-time faculty attendance visibility, directly benefiting over 200 students and 20 Computer Engineering faculty members.
- Implemented SQLite for efficient local data management, ensuring sub-100ms query response times and reliable departmental use.
- Designed an intuitive dashboard to streamline student-faculty communication, cutting departmental inquiry response delays by 35%.

CRADLE: A mobile application dormitory finder within GCH of Batangas City | Lead Software Developer

- Engineered a cross-platform mobile application using Flutter and Dart to simplify the housing search for an initial target base of 50 students in Batangas City.
- Integrated Firebase to handle real-time data synchronization for listings and secure authentication, achieving sub-second query load times and a seamless User Experience.
- Designed high-fidelity wireframes and interactive prototypes in Figma, improving initial UI/UX testing task completion rates by 25%.
